

NEW from STERIMEDIX

Single-use needles for dermal fillers

Sterimedix has recently introduced a unique range of needles for the injection of dermal fillers. Packed in convenient soft blisters, in strips of 5 and boxed in units of 100 needles, Sterimedix's advanced needle technology offers the opportunity to customise the needle design to match the specific properties of the filler.

Based on over 20 years experience of micro-needle and instrument manufacture for ophthalmology, Sterimedix now offers a range of needles designed to optimise the injection force required for each filler, enhancing the experience for both patient and practitioner.

Using thin wall and ultra thin wall technology Sterimedix dermal filler injection needles optimise the needle diameters and minimise injection forces.

Our objective is to understand your specific needs and provide the injection solution to maximise product performance and patient comfort. For more information please do not hesitate to contact us.
